This interdisciplinary conference represents a useful opportunity for international sharing of methodologies that can build up a communal language and approach in Urban Health. Occasions like this represent not only an exchange of knowledge between different disciplinary sectors, but also lay the foundations for an increasingly complex network of scientific culture and operational collaboration. Thus, we believe that initiatives like this have the potential to transfer knowledge and to attract the attention of public opinion, influencing decision makers through advocacy. Furthermore, given the main interpretation of Urban health, conceived as quality of life and well-being in the urban and living space, that characterize the conditions of the communities addressed by the research-action carried out by the Sapienza Research Group, it is desirable to imagine the promotion of health protection initiatives and participation to policy-making.

## PROGRAM

- |   |  |
|---|--|
